## Design Patterns Simplified Version

Posted on August 10, 2015 (<http://simpletechtalks.com/design-patterns-simplified-version/>) by admin (<http://simpletechtalks.com/author/admin/>)

[Behavioural Patterns \(http://simpletechtalks.com/tag/behavioural-patterns/\)](http://simpletechtalks.com/tag/behavioural-patterns/) [C++ \(http://simpletechtalks.com/tag/c/\)](http://simpletechtalks.com/tag/c/)

[Creational Patterns \(http://simpletechtalks.com/tag/creational-patterns/\)](http://simpletechtalks.com/tag/creational-patterns/)

[Design Patterns \(http://simpletechtalks.com/tag/design-patterns/\)](http://simpletechtalks.com/tag/design-patterns/) [module \(http://simpletechtalks.com/tag/module/\)](http://simpletechtalks.com/tag/module/)

[problem \(http://simpletechtalks.com/tag/problem/\)](http://simpletechtalks.com/tag/problem/) [software \(http://simpletechtalks.com/tag/software/\)](http://simpletechtalks.com/tag/software/)

[solution \(http://simpletechtalks.com/tag/solution/\)](http://simpletechtalks.com/tag/solution/) [Structural Patterns \(http://simpletechtalks.com/tag/structural-patterns/\)](http://simpletechtalks.com/tag/structural-patterns/)

Design pattern describes solutions to a problem which arises while developing software for a specific condition. Design patterns are basically independent of any programming language. Lot of guys do the mistake of thinking it as an algorithm but its a common way to solve a generic problem which can be simple or complex.

Basically there are three different categories of design patterns depending on the problem they address:

- 1) **Creational Patterns**
- 2) **Structural Patterns**
- 3) **Behavioural Patterns**

### Creational Patterns:

These design patterns solves the given problem by means of object creation mechanism. Normal way of object oriented solution to solve a problem sometimes create design problems and increasing complexity of the software. Thus, a set of design patterns are there to handle such kind of issues. Examples of this category of design patterns are as follows:

- 1) **Factory Method (<http://simpletechtalks.com/factory-design-pattern/>)** – This design pattern is used to create an instance from the family of various derived classes.
- 2) **Abstract Factory Method (<http://simpletechtalks.com/abstract-factory-design-pattern/>)** – This design pattern is used to create an instance from the several family of various derived classes.
- 3) **Builder Method (<http://simpletechtalks.com/build-design-pattern/>)** – This design pattern is used to separate construction and representation of an object to create different objects via same construction process.
- 4) **Prototype Method (<http://simpletechtalks.com/prototype-design-pattern/>)** – This design pattern is used clone mechanism to create a new object from a fully initialized object to minimize cost creation of new object.

**5) Singleton Method** (<http://simpletechtalks.com/singleton-design-pattern/>) – This design pattern is used to create one and only one object of a class of global context to provide co-ordination between various modules of a software.

### **Structural Patterns:**

These design patterns solves the given problem by means of class and object composition to provide required functionality. Examples of this category of design patterns are as follows:

- 1) Adapter** (<http://simpletechtalks.com/adapter-design-pattern/>) – This design pattern is used to adapt the interface of a class into another interface which other module expects.
- 2) Bridge** (<http://simpletechtalks.com/bridge-design-pattern/>) – This design pattern is used to separate out the interface from its implementation logic to provide flexibility.
- 3) Composite** (<http://simpletechtalks.com/composite-design-pattern/>) – This design pattern is used to create a tree structure of objects to provide hierarchies in the software.
- 4) Decorator** (<http://simpletechtalks.com/decorator-design-pattern/>) – This design pattern is used to provide additional functionality to an objects dynamically.
- 5) Facade** (<http://simpletechtalks.com/facade-design-pattern/>) – This design pattern is used to hide the complexities of the system by providing a simple interface to other module of the system.
- 6) Flyweight** (<http://simpletechtalks.com/flyweight-design-pattern/>) – This design pattern is used to share properties of objects to reduce maintenance cost of objects.
- 7) Proxy** (<http://simpletechtalks.com/proxy-design-pattern/>) – This design pattern is used to create an object for another object to hide the complexities and reduce maintenance cost of the object.

### **Behavioural Patterns:**

These design patterns solves the given problem by means of communication between different class objects. Examples of this category of design patterns are as follows:

- 1) Chain of Responsibility** (<http://simpletechtalks.com/chain-of-responsibility-design-pattern/>) – This design pattern is used to handle passing of information from a chain of objects until one of them handles it.
- 2) Command** (<http://simpletechtalks.com/command-design-pattern/>) – This design pattern is used to encapsulate a request as an object.
- 3) Interpreter** (<http://simpletechtalks.com/interpreter-design-pattern-explained-with-simple-example/>) – This design pattern is used to provide a way to include grammar of a language to interpret sentences in the language.
- 4) Iterator** (<http://simpletechtalks.com/iterator-design-pattern-explained-with-simple-example/>) – This design pattern is used to iterate through a similar collection of objects.
- 5) Mediator** (<http://simpletechtalks.com/mediator-design-pattern-explained-with-simple-example/>) – This design pattern is used to encapsulate way of interaction between objects to simplify communication between classes.
- 6) Memento** (<http://simpletechtalks.com/memento-design-pattern-explained-with-simple-example/>) – This design pattern is used to capture an object to expose object's internal state without violating encapsulation.
- 7) Observer** (<http://simpletechtalks.com/observer-design-pattern-explained-with-simple-example/>) – This design pattern is used to handle notification to multiple objects due to one object modification.
- 8) State** (<http://simpletechtalks.com/state-design-pattern-explained-with-simple-example/>) – This design pattern is used to change the functionality of an object whenever its state changes.
- 9) Visitor** (<http://simpletechtalks.com/visitor-design-pattern-explained-with-simple-example/>) – This design pattern is used to provide a way to define a new functionality to a class object without changing its structure.
- 10) Strategy** – This design pattern is used to encapsulate various algorithm inside class to allowing the change of algorithm randomly.
